PROFESSIONAL SUMMARY

DevOps / Platform Engineer with 1.5+ years of hands-on infrastructure and CI/CD experience. Primary infrastructure owner for a multi-tenant AWS platform (Terraform, ECS Fargate, Aurora, CloudFront/WAF) behind a clinic-booking product, designing GitHub Actions CI/CD for zero-downtime container rollouts and gated database migrations. Also delivers full-stack features within a Kubernetes/Helm-deployed, multi-environment product, and independently operates a self-hosted Docker/Nginx deployment with its own build-push-notify CI/CD pipeline. Partners directly with overseas product owners on release and environment planning in English.

SKILLS

AWS: VPC, ECS Fargate, EKS, Aurora, ElastiCache, CloudFront, WAF, SQS, SES, Backup, IAM, Secrets Manager, Route53

IaC & Containers: Terraform, Docker, Kubernetes, Helm, Linux, Nginx

CI/CD & Automation: GitHub Actions, GitOps, OIDC federation, Liquibase, Bash, jq

Observability & Reliability: CloudWatch Logs, Grafana, health checks, zero-downtime deployments

Backend: Nest.js, Node.js, REST/OpenAPI

Databases & Cache: PostgreSQL, MongoDB, MySQL, Redis

Frontend: Next.js, React, Vue 3, TypeScript

Practices: Agile Scrum, Gitflow, Code Review, Infrastructure documentation & runbooks

EXPERIENCE

Tokyo Tech Lab Viet Nam

Software Engineer

Oct. 2024 – Present

- Owned infrastructure-as-code for a multi-tenant clinic-booking platform: authored 151 Terraform resources across 15 modules (VPC, ECS Fargate, Aurora PostgreSQL Serverless v2, ElastiCache Redis, CloudFront + WAF, SQS, SES, AWS Backup, Bastion), provisioning the first production tenant environment alongside shared dev/staging, with the module layout built so each additional clinic gets an isolated one.
- Built GitHub Actions deployment pipelines that patch ECS task definitions, register new revisions, and roll out API/worker services with automated stability checks and old-revision cleanup, removing manual steps from every release.
- Engineered a branch-gated Liquibase migration pipeline that runs as a one-off ECS Fargate task per environment and auto-generates CloudWatch Logs links for failure triage.
- Authored the S3 + CloudFront deployment pipeline for the frontend, using immutable cache-control on hashed assets with targeted invalidation for zero-downtime SPA releases.
- Wrote the infrastructure README and environment-provisioning runbook that other engineers follow to onboard new client environments.
- Support release and environment needs for two additional concurrent client products — the Kotae AI chatbot platform and StarLive real-time streaming — in teams of 14–15 engineers, working directly with overseas product owners in English.

Software Intern

Apr. 2024 – Oct. 2024

- Built Gitman, an internal Git repository management tool, from scratch with Vue.js, TypeScript, Nest.js, and MongoDB, and released it for company-wide internal use.
- Shipped Vue 3 and TypeScript workflow features into the production HRM platform as one of 20 engineers.

PROJECTS

ERC Booking System – Infrastructure & CI/CD

Jan. 2026 – May. 2026

Role: DevOps Engineer / Backend Developer | Tokyo Tech Lab (client product) | Team of 5

Tech: Terraform · AWS (ECS Fargate, Aurora, ElastiCache, CloudFront, WAF, SQS, SES, Backup) · GitHub Actions · Docker · Liquibase

Clinic scheduling platform architected for per-tenant isolation; primary owner of its cloud infrastructure and deployment pipelines.

- Designed and provisioned a 15-module, 151-resource Terraform codebase spanning networking, compute, data, messaging, CDN/WAF, and backup for per-tenant production isolation, then used it to stand up the first production tenant plus shared dev/staging.
- Built zero-downtime ECS rollout pipelines (task-definition patch → register → update-service → stability wait → deregister old revisions) with path-based selective builds for API vs. worker services.
- Implemented a gated, environment-aware database migration pipeline (Liquibase on ephemeral Fargate tasks) with automatic CloudWatch log-link generation for on-call triage.
- Shipped the S3 + CloudFront frontend pipeline with immutable-asset cache headers and cache invalidation for zero-downtime SPA releases.
- Replaced MinIO with LocalStack S3 in local/CI environments for closer parity with production S3 behavior.

Kotae – AI Chatbot Platform · kotae.ai

Aug. 2024 – Present

Role: Full-stack Developer | Tokyo Tech Lab (flagship client product) | Team of 14

Tech: Next.js · Nest.js · TypeScript · AWS · Kubernetes/Helm · Docker

AI-powered chatbot SaaS platform for SME customer support, serving 10+ SME customers, deployed via Kubernetes/Helm across four isolated environments (dev, test, demo, production).

- Delivered Nest.js APIs and Next.js admin/embed UI within a Helm-charted Kubernetes deployment (per-environment values, HPA, ingress) spanning four isolated environments from dev through production.
- Built chat/Socket.io session flows and Redis/Bull background jobs for analytics aggregation, releasing through the platform's reusable multi-environment GitHub Actions deploy pipeline.
- Shipped chatbot configuration, knowledge-base training workflows, and analytics dashboards into a production system running across concurrent client environments.

Personal Portfolio – Self-Hosted CI/CD · portfolio.anvd.io.vn

Sep. 2025 – Present

Role: Independent Developer | Solo project

Tech: Docker · Nginx · GitHub Actions · Watchtower · Telegram

Multilingual personal site, solely designed, built, and operated end-to-end, including its own self-hosted deployment stack and CI/CD pipeline.

- Containerized the site with a multi-stage Dockerfile (deps → builder → runner) around Next.js standalone output, running as a non-root user with a container health check.
- Composed the production stack with Docker Compose: app container + Nginx as TLS-terminating reverse proxy, plus Watchtower polling Docker Hub for automatic image updates with zero manual intervention.
- Orchestrated CI/CD as two reusable GitHub Actions workflows chained by a top-level pipeline on push to main: `ci.yml` (lint, type-check) gates `cd.yml` (Buildx image build, GHA layer caching, push to Docker Hub tagged `latest` and by commit SHA).
- Wired Telegram notifications into the pipeline for deploy success/failure and site contact-form submissions, giving real-time visibility into both delivery and production usage.

EDUCATION

Dai Nam University

2020 – 2024

Bachelor of Science in Information Technology (GPA: 3.58 / 4.0)
